JIB CRANES

*The **jib cranes** made by Donati Sollevamenti offer the most complete range of solutions for the handling of loads up to 10.000 kg, based on in-depth knowledge of the most varied applications and on more than 70 years of experience in lifting.*

Mass production carried out with industrialised processes allows the production via economies of scale of completely reliable cranes which are technically innovative and offer excellent value for money.

The quality of the components used and the excellent finish of the steel structures as well as the quality system certified UNI EN ISO 9001: 2008 allows us to offer a product of superior quality, which is long-lasting and in line with the latest international regulation standards.

The jib cranes are part of the range of products for lifting built by Donati, the leading Italian company and one of the biggest at world level in the lifting sector.

DONATI SOLLEVAMENTI S.r.l. designs and builds jib cranes and wire rope hoists.
This harmony in design and construction ensures perfect integration of components and allows us to offer the market 3 years of warranty.

donati

DESIGN, CONSTRUCTION AND RANGE

The jib cranes, manually or electrically rotated in column- or wall-mounted models, are designed to handle goods inside a plant, in a large square or to serve operative positions.
The jib cranes have three functions:
Lifting a load vertically using the hook of the lifting unit, generally consisting of a DMK chain hoist or a DRH wire rope hoist;
Travel the load with the help of a hoist-carrying trolley, electric or manual, which run along the jib of the crane (with the exclusion of the crane with an articulated arm where the hoist normally does not run with the trolley because the hoist is fixed at the ends of the arm);
Rotating the load, around the connection axis of the arm, using a manual push action on the load itself or electrically by means of a motor reducer, using the circular area underneath it, bound by the rotation range of the arm.

The jib cranes are available in standard models for loads from 63kg to 10.000kg and jibs from 2m to 10.5 m in the following combinations:

Manually rotated jib cranes, maximum lifting capacity 2.000kg
- GBA column-mounted series, rotation 300°
- GBP wall-mounted series, rotation 270°

Jib cranes with articulated arm, maximum lifting capacity 500kg
- CBB column-mounted series, manually rotated 360°
- MBB wall-mounted series, manually rotated 360°

Jib cranes with motorised arm, maximum lifting capacity 2.000kg
- CBE column-mounted series, electrically rotated 300°
- MBE wall-mounted series, electrically rotated 270°

Continuously electrically rotated jib cranes, maximum lifting capacity 10.000kg
- GBR column-mounted series, electrically rotated 360°

CONSTRUCTION SPECIFICATIONS

Modularity of the components
All the jib cranes built by Donati Sollevamenti Srl are made according to the conception of modular components which assembled together in relation to commercial needs, as well as the standard versions always available from the warehouse, allow the rapid, economical realisation of numerous standardised and special applications. The base components, columns, brackets and arms, thanks to their extreme compactness are assemblable together so as to guarantee the maximum use of the hook run and, thanks to their minimum lateral encumbrance, allow the optimal use of the area in which the jib crane operates.

The column-mounted model
The column-mounted crane consists of a supporting column, made of press-forged steel with a tubular structure with a polygonal section. This allows a high rigidity and stability of the crane and is fixed to the base with a base plate and a system of bolts and log bolts. In the upper part a pair of plates support the arm and allow it to rotate.

Support bracket
The wall-mounted jib crane consists of a bracket support structure. This is formed by a pair of plates made of press-forged steel, fixed to the wall or anchored to a pillar with staybolts or screws which act as a support to the arm and allow it to rotate.

Rotating arm
The arm, rotating around its own axis, consists of a supporting girder for the run of the hoist-carrying trolley.
Depending on the model it can be made in profile or channel version designed by Donati.

The braking device of the arm
The arm of the manually rotated jib crane is fitted in all models with a braking system.
The brake, with clutch with asbestos-free friction material, allows the regulation of the force of rotation of the arm and ensures the stability of positioning.

Fixing systems of the crane
Foundation frame with log bolts
The jib cranes are generally designed to be fixed to the ground using the foundation frame with log bolts inserted in a foundation plinth.
Chemical dowelling
The fixing of the column to the floor can be done using chemical dowelling, also with a counterplate where necessary which allows better distribution of forces.
The brackets and staybolts unit
This is used for fixing the bracket jib crane to a supporting pillar and is fitted with a pressure screws system which guarantees a better adhesion of the staybolts to the pillar.

Donati lifting equipment
Safe, versatile DMK electric chain hoists are used and for higher loads the DRH electric wire rope hoists with 1 or 2 lifting speed and moving speeds.

The height of columns and the length of arms
The range of the jib cranes is characterised by a vast availability of standard models and made-to-measure in special models.
All the cranes with a column of "base" height and also in half-metre variation the cranes up to a top height of two metres as shown in the following table are standard models:

"Standard" heights of the columns (m)							
Series	Crane Height	Dimension	Height "Base"	other "Standard" heights			
GBA-CBB-CBE	R-S	H	3	3.5	4	4.5	5
	T-U	H	3.5	4	4.5	5	5.5
	V-Z	H	4	4.5	5	5.5	6
GBR	2-3-4-5-6	h	4	4.5	5	5.5	6

All the cranes with columns of heights different from the standard ones with "made to measure" heights are made in special execution or exceeding two metres or of a lower height with respect to the "base" column. Moreover the cranes with an arm of a length different to the standard ones shown in the relevant technical tables are special models.

Finishing
Protection from atmospheric agents and environmental ones (dust, gas, etc.) is guaranteed by the varnishing treatment which includes the application of yellow paint with a base coat of a thickness of 40 microns and a top coat of thickness of 40 microns, subject to preparation of the surfaces by metallic sandblasting with SA2 grade.
The drying in an oven for 40 minutes at a temperature of 80° C concludes the cycle.

Service class
The structural elements of the manually or electrically rotated, column-mounted or wall-mounted, jib cranes are dimensioned in the class of service ISO A5 (according to ISO 4301/86).

Protection and insulation of electrical parts
Rotation motor: Protection IP54 (motors) IP23 (brakes); insulation class "F" (where necessary)
Electrical panel: Minimum protection IP55 – Maximum power of insulation 1500V (where necessary)
Push-button panel: Protection IP65 - Maximum tension of insulation 500V (where necessary)
Collector: Protection IP65 – Maximum power of insulation 600V (where necessary)
Rotation limit switch: Protection IP65 – Maximum power of insulation 500V (where necessary).

Connector blocks: Minimum protection IP65 – Maximum power of insulation 1500V
Cables: CEI 20/22 – Maximum power insulation 450/750V.

Electrical power supply
The electrical jib cranes are designed to be powered with alternate electric power three-phase of: 400V according to IEC38-1.
The CBE series "column" and MBE "wall" electrically rotated jib cranes must be powered with alternate electrical power with three-phase power +neutral+earth (-3+N+T).

Environmental conditions of use
Use temperature: minimum –10°C; maximum +40°C
Maximum relative humidity: 80% - Maximum altitude 1000m above sea level.
The standard **crane** must be installed in a ventilated environment, free from corrosive vapours (acid vapours, saline clouds, etc) and is designed for use in an indoor area (protected from bad weather).
On request the crane can be supplied in the version designed for outdoor use.

Noise
The level of acoustic pressure emitted by the hoist is always lower than 85dB(A).
The incidence of environmental characteristics such as transmission of sound by metallic structures, reflection caused by combined machines and walls, is not included in the figure shown.

SPECIAL VERSIONS

On request the following can be supplied for all the cranes:

Special anticorrosive **paint.**
Protection **cover** for motors and control panel.
Rotation **motor** with stainless steel brake blocks and /or tropicalisation (for electrically rotated cranes).
Anticondensation **heaters.**
Area limiters.

Supplementary electrical safety limit **switches.**
Power supply **voltages** different from the standard ones (for electrically rotated cranes).
Columns with a double arm.
Personalised column **heights** and arm **lengths.**

MANUALLY ROTATED JIB CRANES

GBA ***"column" series***
Maximum rotation field 300°
(290° in the T version)

GBP ***"wall" series***
Maximum rotation field 270°
(250° in the T version)

The manually rotated **jib cranes** in the **GBA"column" series** and the **GBP "wall" series** are designed for the handling of goods inside a plant, in a square or to serve operative positions.
The standard models are available for **lifting capacities from 125 kg to 2000kg and jibs from 2m to 8m**
The **C-T-H** versions are designed according to the three different versions of the arm.

"C" Channel version for lifting capacities from 63kg to 1000kg and jibs from 2m to 7m
The arm is made using a special section bar made of folded sheet metal, inside which the hoist-carrying trolley run.
The arm is fitted with one or two staybolts which support the profile and connect it to the rotation tube.
This version is characterised by the extreme ease of handling due to the low inertia derived from its own reduced weight.
The arm is normally fitted with a special "channel" profile trolley, which allows it to be pushed with maximum fluidity.

"T" cantilever version, for lifting capacities from 63kg to 2000kg and jibs from 2 m to 5 m
The arm is made using a laminate T-beam form: the hoist-carrying trolley run on the lower flange of the T-beam.
The girder is self-supporting and cantilevered, so it has no support staybolts, and it is directly integral with, via suitable reinforcements, the rotation tube.
This version allows the optimum use of the

manual jib crane

available space at a height due to the absence of staybolts and allows the maximum use of the hook run. The arm allows the addition of electrical or mechanical push-trolleys.

"H" overbraced version, for lifting capacities from 125kg to 2000kg and jibs from 4m to 8m
The arm is made using a H-beam section, the hoist-carrying trolley run on the lower flange of the H-beam. The arm is fitted with one or two staybolts to support the profile which connects it to the rotation tube.
This version allows the use of the jib crane for loads and jibs superior to those possible with the C and T versions. The arm allows the addition of electrical and mechanical push-trolleys.

Electrical power supply
This is designed to power the hoist and/or electrical trolley, which run along the jib of the crane.
It uses a connection box for the connection between the line and the power festoon cable, situated on the top of the column crane or near the bracket support in the wall version.

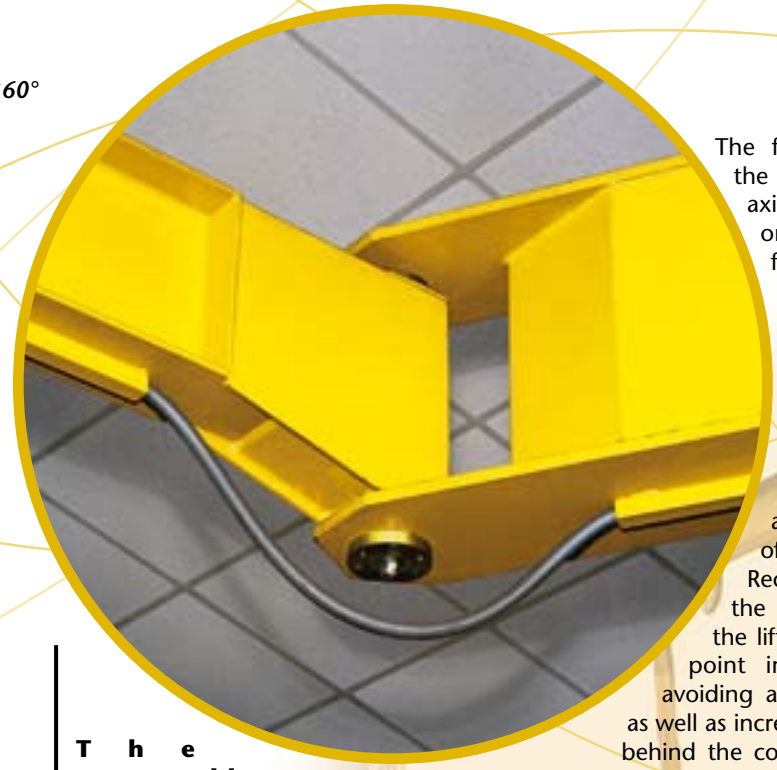
The column crane can be supplied, on request, with a **main on/off line switch** which can be padlocked. The distribution of energy takes place via a flat festoon cable which slides on trolley along the arm.

Technical cards on pages 18-19-20

JIB CRANES WITH AN ARTICULATED ARM

***CBB**: "column with articulated arm" series*
Maximum rotation field 360°

***MBB**: "wall with articulated arm"series*
Maximum rotation field 360°



The manually rotated jib cranes with an articulated arm in the CBB "column" series and the MBB "wall" series, are designed for the handling of goods inside a plant or a building site where the presence of fixed obstacles would impede the free rotation in terms of the mobility of the arm when it is formed by one rigid element.
The cranes **"with an articulated jib"** are fitted with an arm made of two hinged "pantograph-shaped" segments which allow it to avoid fixed obstacles during rotation.
The standard models are available for **lifting capacities from 125 kg to 500 kg and jibs from 2 m to 7 m.**
In the version designed for the application of manipulators the maximum load is 125 kg.

Articulated jib
The jib cranes, both in the wall and column versions, are fitted with an "articulated arm", which rotates on its own axis.
The articulated arm is made using two cantilevered girders, which form the two hinged segments (semi-arms).
The semi-arm on the "tie" side is generally made in boxed casing, while the "cantilever" side can be made using a T-beam or a tubular profile.

The first segment (semi-arm on the tie side) rotates around the axis situated on the column or on the bracket where it is fastened.
The second segment (semi-arm on the cantilever side) rotates on the ends of the first segment and is fitted with a planarity regulation system.
The two semi-arms can be of different lengths and are able to rotate independently of each other.
Reciprocal mobility, thanks to the "pantograph" effect, allows the lifting equipment to reach any point in the area to be served, avoiding any obstacles to the rotation as well as increasing the surface area served behind the column or fixing pillar of the bracket.
The entire articulated arm is directly integral with, via suitable reinforcements, the rotation tube.
The two semi-arms, rotating on their own rotation axes via bearings, allow the optimal use of the available space at a height due to the absence of staybolts.

Electrical power supply
This powers the hoist and for the connection between the line and the power cable has:
Terminal box near the support bracket in the MBB wall version.
A **main on/off line switch** which can be padlocked is positioned on the column in the CBB version.
The distribution of energy takes place via cable.
Electrical line with round multipolar flexible cable inserted in a channel welded under the flange of the jib.
Push-button panel hanging from the hoist.

crane with an articulated arm

Technical cards on pages 21 - 22 - 23

JIB CRANES WITH MOTORISED ARM

***CBE**: "column" series*
Maximum rotation field 300°
(290° in the T version)

***MBE**: "wall" series*
Maximum rotation field 270°
(250° in the T version)

The electrically rotated jib cranes with a motorised arm in the CBE"Column" version or the MBE "wall" version are designed for handling goods in areas which are difficult to reach, where the presence of fixed obstacles would impede the practicability of the working area.
They are used also when the frequency of manoeuvres, the entity of the load and the push forces, could cause excessive wear and tear if carried out manually.
Available in standard versions for **lifting capacities from 250 kg to 2000kg and jibs from 2m to 8m,** in **T and H** models according to the different layouts of the arm.

"T" cantilever version, for loads from 500kg to 2000kg and jibs from 3m to 6m
Made using solid section T-beam: the hoist-carrying trolley run on the lower flange of this.
The girder is self-supporting and cantilevered, so without support staybolts, and is directly integral with, via suitable reinforcements, the rotation tube.
This version allows the optimal use of the available space at a height due to the absence of staybolts and allows the maximum use of the hook run.
The arm allows the addition of electrical or mechanical push-trolleys.

"H" overbraced version, for lifting capacities from 250 kg to 2000kg and jibs from 4m to 8m
Made using an H-beam section girder, where the hoist-carrying trolley run on the lower flange. The arm is fitted with one or two staybolts to support the profile which connects it to the rising rotation tube.
This version allows the use of the jib crane for lifting capacities and ranges superior to those of the T version.
The arm allows the addition of electrical or mechanical push-trolleys.

Rotating arm
The arm, swivelling on its own axis on revolving bearings, is formed by a supporting girder for the run of the hoist-carrying trolley.

The rotation mechanism
Formed by a motor reducer fixed vertically in the lower part of the support bracket, made with a reducer of epicycloidal type, with gears in a permanent oil and self-braking conical brake motor.
The drive sprocket of the motor reducer fits together with a toothed crown integral with the arm which it powers.The progressive starting up and braking are ensured by a variator of frequency (inverter) powered by alternate monophase power with 230V voltage.

Electrical power supply

To power the hoist and the trolley which run along the arm of the crane as well as the rotation motoreducer.

The power supply includes **two electrical control panels**, one for the control of the lifting and travel unit of the hoist, while the rotation control equipment is integrated with the motoreducer.

Inside the panels the contactors for the control of all the movements of the crane are positioned. The control circuits are low voltage (48V) obtained via a transformer protected by fuses.

An easy-to-use connection terminal box, with numbered terminals, ensures simplicity and safety of the cabling of the cables related to all the external functions making any inspection easy to perform.

Power line to power the trolley-hoist formed by flexible flat multipolar cables festooned on the sliding trolleys on the lower flange of the beam.

Push-button control panel, suspended on the hoist, with a case in shockproof thermoplastic, supported by a self supported round multipolar cable.

When necessary it is fitted with a rapid socket with obliged polarity to make it easier to assemble and to replace.

On request an independent, sliding, push-button panel can be installed along the jib of the crane, via cable-carrying sleds running inside a channel profile.

Acoustic alarm, when included, controlled by an "alarm" button serves the function of acoustic warning to indicate any dangerous situations during handling.

Electric safety **limit switch** on the rotation movements, installed as standard to delineate the rotation field of the arm of the crane.

Working on the auxiliary circuits at low voltage, two thresholds of intervention both in right rotation and left, also carries out the emergency function in safety if there is any breakdown or malfunctioning of the first threshold of intervention.

For the connection to the line there is:

- on the jib crane a main on/off line switch which can be padlocked
- on the bracket crane a connector block.

Powered by alternate electric power with three-phase voltage + neutral+earth (- 3+N+T).

Technical cards on pages 24-25

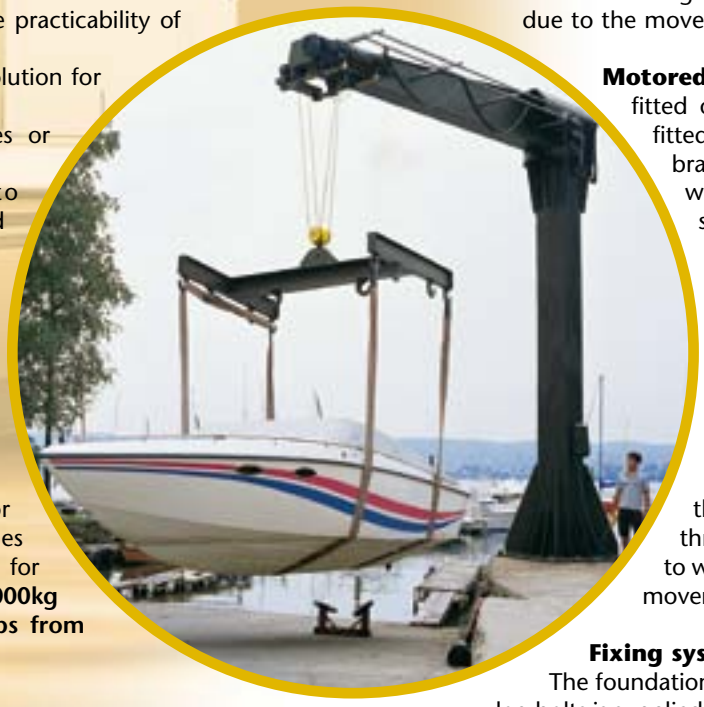
360° ELECTRICALLY ROTATED JIB CRANES

Series GBR: 360° slew

The GBR series electrically rotated jib cranes are used to handle loads whose mass (high or bulky) does not allow manual handling. They are also used when fixed obstacles impede the practicability of the working surface.
They are the ideal solution for handling:

- in outdoor squares or deposits
- on wharves, to load and unload materials for watercraft
- on wharves to haul boats
- on loading ramps, for handling materials for lorries
- for services of big operating units or assembling machines

Available as standard for **lifting loads from 1000kg to 10.000kg and jibs from 4m to 10.5m.**



Column
Made of press-forged steel section welded to the tubular structure with polygonal section it allows a high rigidity and stability; it is fixed with a base plate and a system of bolts and logbolts. The upper part is fitted with a flange for fixing the rotation thrust bearing.

Rotating arm
This is formed by a supporting girder and, in relation to the lifting capacity and/or the jib lenght, can be made with an H beam or with a box beam designed to guarantee the maximum flexotorsional stability. In the construction of the box beam high-quality section steel is used and welding carried out with continuous line procedure to ensure optimal safety conditions and operative reliability of the crane.
It is fitted with a flange with holes for the application of the thrust bearing to which it is fixed using high resistance bolts.
The rotation of the arm of the crane, which is mounted on a rotating thrust bearing, is ensured via a motoreducer.
The circular area served by the arm can, according to necessity, be limited by electrical limit switches, or allow continual rotation, without end, of the arm itself in both directions by a collector ring.

Rotation mechanisms
Base bearing or thrust bearing, able to support both axial pushes, due to vertical forces and the tilting momentum due to the movement.

Motoreducer, fitted on the arm, fitted with a self-braking motor with progressive start-up and braking where the sprocket, keyed on the slow shaft, fits together with the internal toothing of the thrust bearing to which it gives movement.

Fixing system
The foundation frame with log bolts is supplied, on request, for fixing the column to the base (foundation plinth).

Electrical power supply
Made for powering the hoist and trolley which run along the arm of the crane as well as to power the rotation motoreducer and includes **two electrical control panels,** one to control the lifting and moving on board the trolley/hoist unit, while the control apparatus of the rotation motoreducer is integral with to the arm. Inside the panels there are the contactors for the control of all the movements of the crane, as well as protection fuses against short circuits.
The control circuits are at low voltage obtained via a transformer protected by fuses. A connection terminal box, with numbered terminals, ensures simplicity and safety of the cabling of the cables relative to all the external functions making any inspection easy to perform.
Alternatively, on request, the crane can be supplied with **one electrical panel only** made of press-forged sheet, which contains the contactors and the timers to control all the movements of the crane, as well as protection fuses against short circuits. The control circuits are low voltage. A connection terminal box ensures simplicity and safety of cabling of the cables relative to all the external functions

electrically rotated cranes

making any inspection easy to perform.
The electrical line to power the trolley-hoist formed of flat flexible multipolar cables festooned on the trolleys which slide inside a channel section.
A hanging **push-button control panel**, with a shockproof thermoplastic casing, sliding, along the crane girder, via trolleys inside a channel section using festooned flexible multipolar cable.
It is supported by a self supported round multipolar cable.
It is generally fitted with a connector with fast connectors and obliged polarity, to make assembly and replacement easier.
Acoustic alarm, when necessary, controlled using an "alarm" button it serves the function of acoustic warning to indicate any dangerous situations during handling.
Rotating **collector ring** installed when the arm of the crane is free from obstacles in every point of its rotation and the arm itself is required to rotate continuously in both directions.

Electric safety **limit switches** on the movements of rotation installed to limit the rotation field of the arm of the crane. Acting on the low voltage auxiliary circuits, with two intervention threshold both rotating right and left and it serves the function of emergency in safety in case of any breakdown or malfunctioning of the first intervention threshold.

Technical cards on pages 26-27

QUALITY PRODUCTS FROM A LEADING COMPANY

The range of products covers every aspect of industrial lifting offering unbeatable value for money together with pleasing, professional design.
The DMK electric chain hoists for lifting loads up to 4000kg, the manually and electrically rotated jib cranes, the DRH wire rope hoists with lifting capacity up to 40.000kg, the DSC suspended modular systems and the DGP drive units are all a safe, reasonably-priced choice for every situation.
The special versions of each product, on request some also with CSA/UL homologation, complete the range guaranteeing an answer to the most varied and specific application needs.
The constant attention paid by **DONATI SOLLEVAMENTI S.r.l** to the maximum satisfaction of its clients is focused on creating a long-term relationship of mutual esteem and trust thanks to the flexibility and promptness of its organisation and the direct personal touch. The after sales service aims to resolve problems immediately whether they involve spare parts, assistance or guarantee.

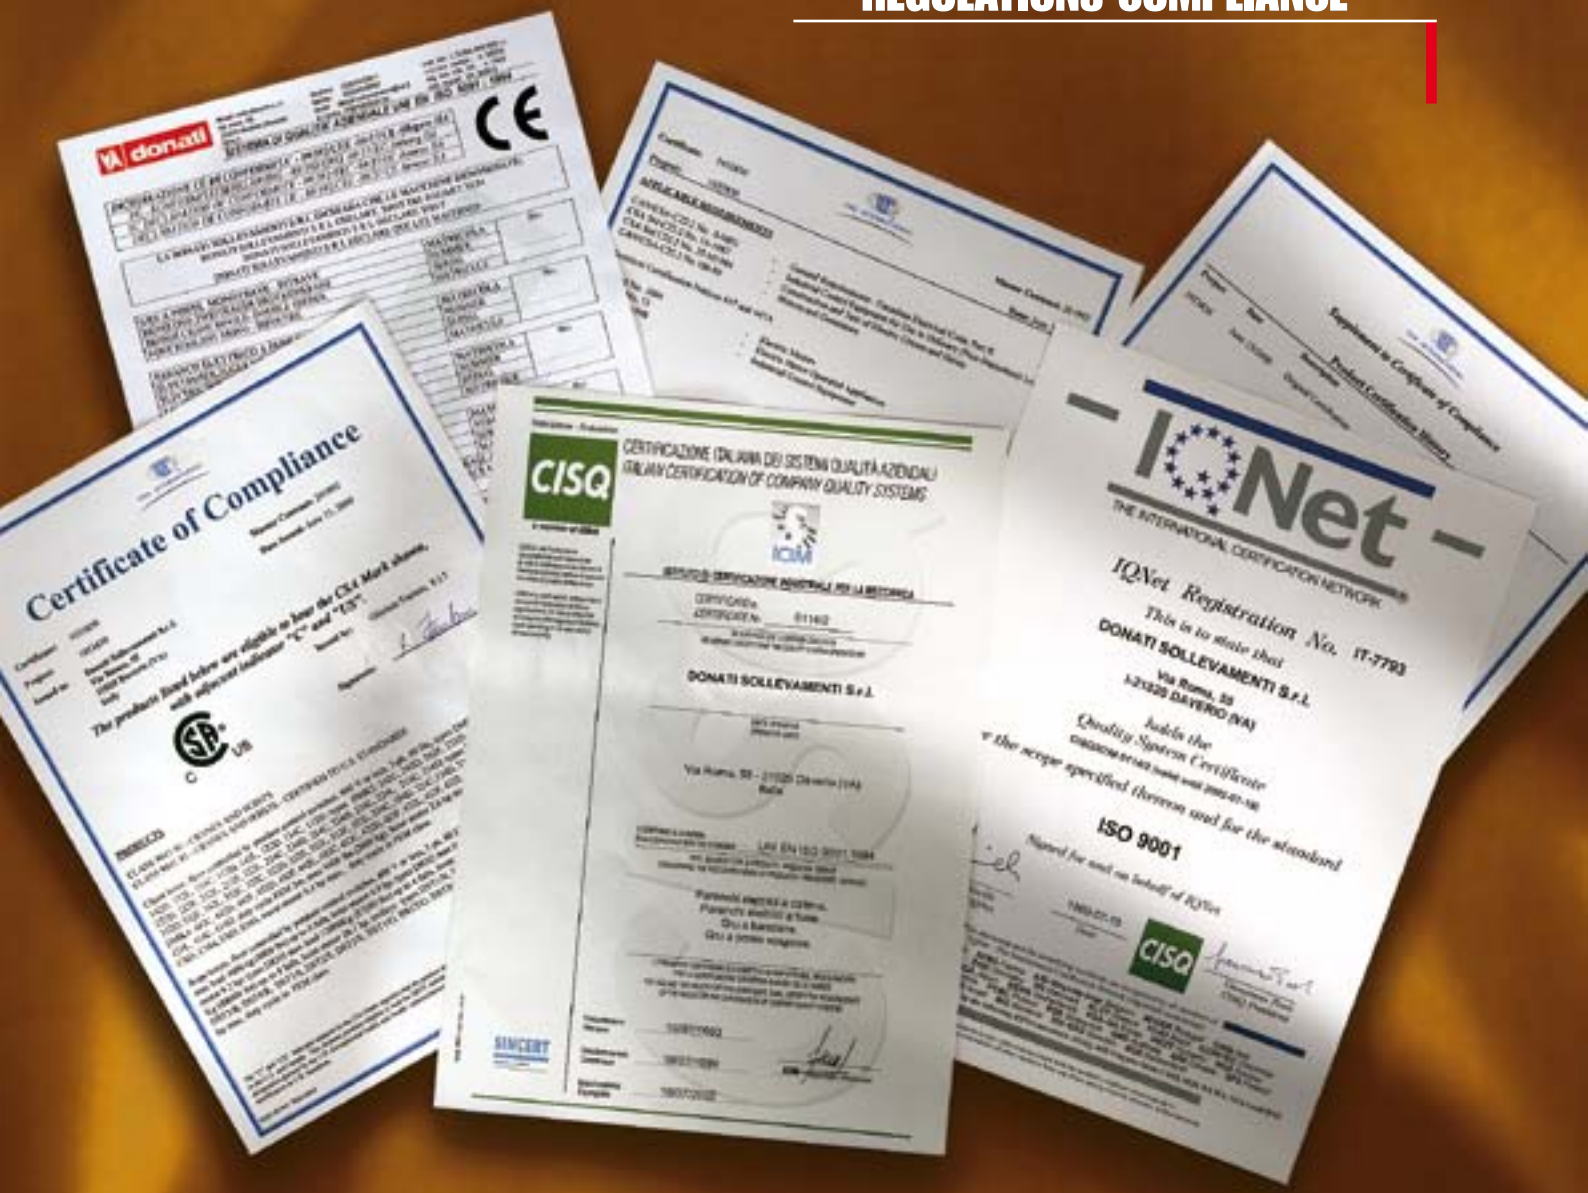
Since 1930 DONATI SOLLEVAMENTI S.r.l. has been on the world market of industrial lifting with growing success with competence, flexibility and both technological and planning innovative capacity.
The experience gained in long years of qualified presence in the sector and the precise will to tackle without compromise the problems related to safety and conformity to regulations are a guarantee.
Consistancy in quality and reliability of all our products and services is guaranteed by the certification of our system of quality assurance which since 1993 regulates in Donati organisation, the control of materials, the production processes and the finished products.

DONATI SOLLEVAMENTI S.r.l. offers a product which is always in line with the most modern international regulation standards.

donati

11

REGULATIONS COMPLIANCE



Legislative reference framework

The manually or electrically rotated column and wall-mounted jib cranes are designed and produced in consideration of the "Essential Safety Requirements" of **Attachment I of the Community Directive 2006/42/CE.** The jib cranes are put on the market with the CE mark and the EC Declaration of Conformity– Attachment IIA.

Moreover the jib cranes conform with the following directives:

– **Low Voltage Directive 2006/95/CE**

– **Electromagnetic Compatibility Directive 2004/108/CE**

Regulations reference framework:

In the planning and construction of the manually and electrically rotated, column and wall-mounted, jib cranes, the following norms and main technical rules have been taken into consideration:

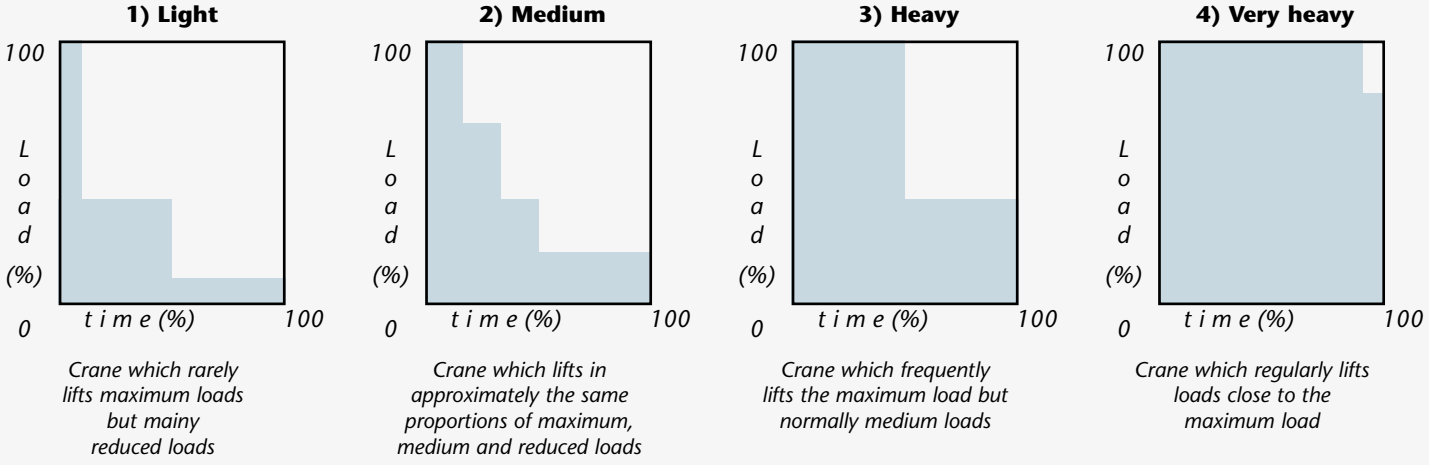
- EN ISO 12100 part: 1ª - 2ª/2005 – Safety of the machinery
- EN ISO 13849-1/2006 – General principles for design
- EN 60204-32/98 – Safety of machinery electrical equipment of machines
- EN 60529/92 – Degrees of protection provided by enclosures (IP code)
- ISO 4301/86 – Lifting equipment classification
- FEM 1.001/98 – Rules for the design of hoisting appliances
- FEM 9.683/95 – Selection of lifting and travel motors
- FEM 9.755/93 – Measures for achieving safe working periods for serial hoists units (S.W.P.)
- FEM 9.941/95 – Graphical symbols for controls devices

CRITERIA OF CHOICE AND LIMITS OF USE OF THE JIB CRANES

To obtain the complete responsiveness of the jib cranes, for the service they are intended for, it is necessary to check the parameters which characterise the limits of use and, thus, the right choice.
These are essentially the **effective carrying capacity**, the **state of stress** and the **functional parameters**

1) Actual lifting capacity
This is determined by the heaviest load to be lifted

2) Stress level
The stress level is determined considering the actual entity of the loads to be lifted and it is ascribable to one of the four load regimes shown below.



Crane which rarely lifts maximum loads but mainy reduced loads

Crane which lifts in approximately the same proportions of maximum, medium and reduced loads

Crane which frequently lifts the maximum load but normally medium loads

Crane which regularly lifts loads close to the maximum load

Check, on the basis of the state of stress intended for the crane, that the limits of use, type of service and n° of cycles intended in 10 years of work is not in contrast with the following table.

Limits of use of the jib cranes of the service class ISO A5 (according to ISO 4301/86)

State of stress	1) Light	2) Medium	3) Heavy	4) Very heavy
Type of service	intense irregular use	intermittent regular use	regular light use	irregular use
Conditions of use	U 6	U 5	U 4	U 3
N° of operative cycles in 10 years	1.000.000	500.000	250.000	125.000

3) Functional parameters
The functional parameters which must be carefully considered in the choice of jib cranes are:

• **Functional dimensions:** height of the arm, which determines the hook run of the hoist, and its jump (jib) must be selected so as to guarantee the functional coverage of the area to be served in consideration of the surrounding encumbrances.

• **Type of movement** (where necessary): manual or electric in relation to the characteristics of the mass to handle and the type of arm already selected.

• **Nature of the load:** delicate or not determines by its positioning the choice of the most suitable speeds of handling (lifting and moving). In some cases it is indispensable to use hoists with two speeds with a slow speed of positioning.

• **Area of use:** the jib crane is characterised, by its conception, by intrinsic high elasticity which becomes even more evident when it is used for handling with loads close to the maximum lifting capacity and/or with prevalent localisation at the ends of the arm.

• **Area of use:** the jib cranes are intended to be used inside and/or in a covered area, sheltered from bad weather and wind. In the case of use outside measures must be taken in relation to the surface treatment (sandblasting - painting) as well as:
- **in the case of manually rotated cranes:** a system of stopping brake and an adequate protection cover for the hoist-trolley.
- **in the case of electrically rotated cranes:** adequate protection covers for the hoist-trolley, for the motoreducer and for the electrical panel.

• **Frequency of use:** if use is very high (frequent and/or repeated manoeuvres) with loads close to the maximum load the consequent fatigue of the operator due to the manual handling must be taken into consideration.

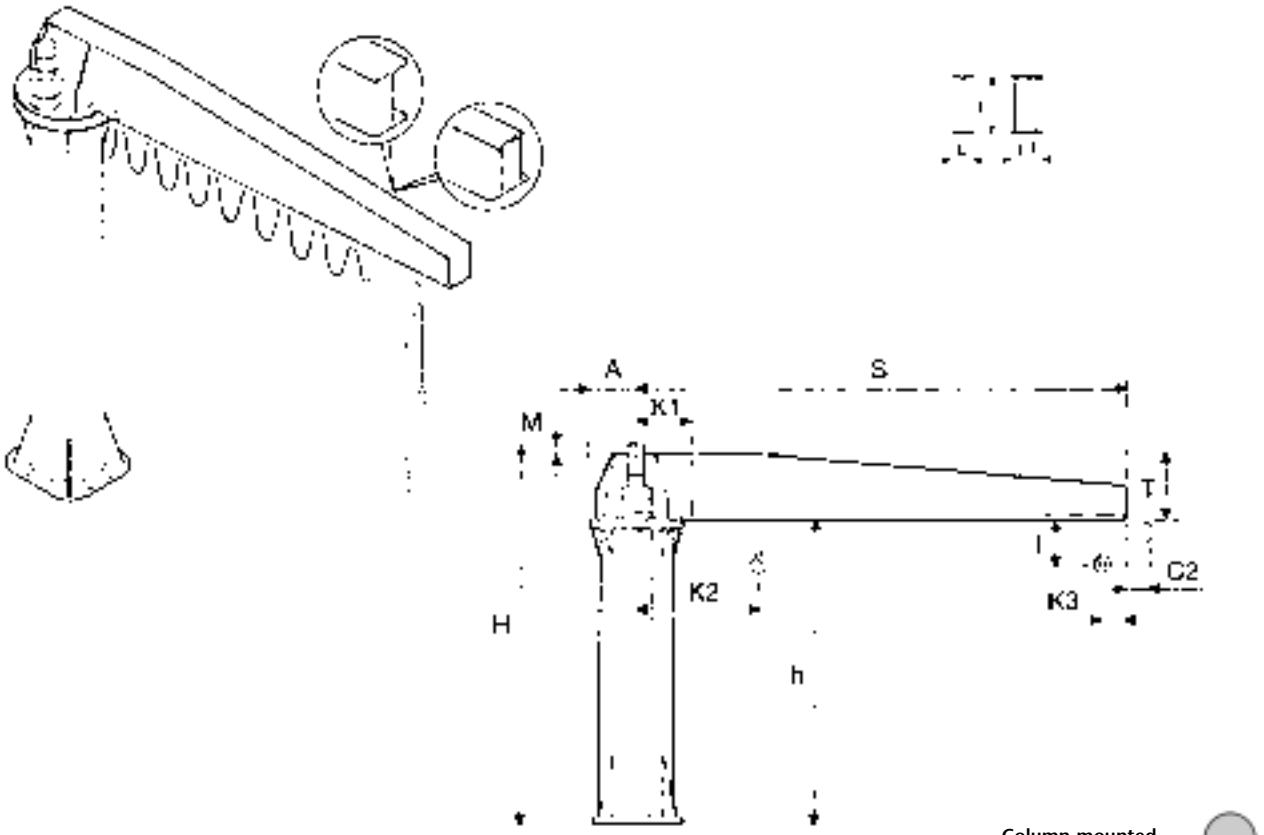
GBR SERIES COLUMN-MOUNTED JIB CRANE –ELECTRICALLY ROTATED AT 360° CONTINUOUSLY



Column-mounted crane - Rotation 360°

GBR jib cranes with DRH electrical wire rope hoist:
K2 = K1+(C+I1-S3)* referring to fixed mechanical limit switch
K3 = (C+S3)* referring to fixed mechanical limit switch
I* and C2* = (*) See commercial catalogue for DRH hoists

GBR jib cranes with DMK electrical caihn hoist:
K2 = K1+(M/2)* referring to fixed mechanical limit switch
K3 = (M/2)* referring to fixed mechanical limit switch
I* = (*) See commercial catalogue for DMK hoists

GBR series column-mounted jib crane – Electrically rotated at 360° continuously

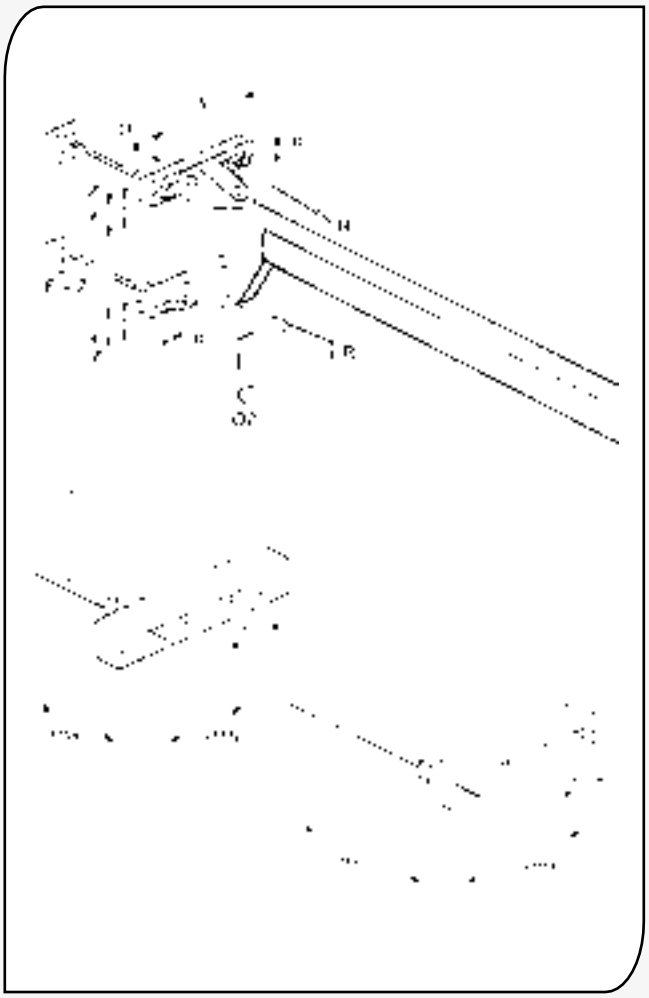
	Z	75		90		135	
	Weight (kg)	21		36		75	
Pillar dimensions (mm)	x min	200		250		300	
	x max	330		400		400	
	y max	850		810		750	
Bracket type: Medium (mm)	Code	GBP010120		GBP020120		GBP030120	
	U	50		80		100	
	V	530		640		682	
	Z	75		120		145	
	Weight (kg)	26		60		96	
Pillar dimensions (mm)	x min	200		250		400	
	x max	460		550		550	
	y max	850		770		710	
Bracket type: Long (mm)	Code	GBP010130		GBP020130		GBP030130	
	U	60		80		120	
	V	720		840		882	
	Z	85		120		155	
	Weight (kg)	40		74		132	
Pillar dimensions (mm)	x min	460		550		550	
	x max	650		750		750	
	y max	830		770		670	

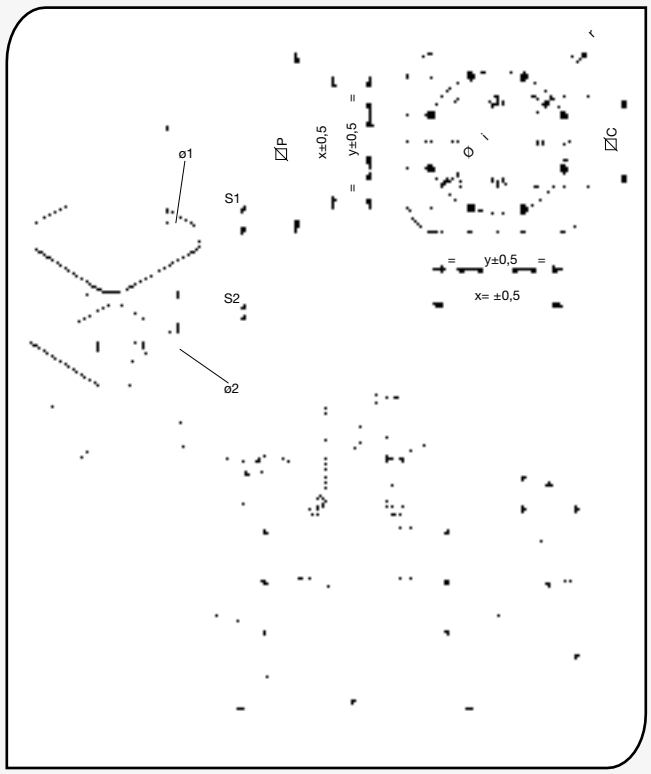


Note: The bracket and staybolts unit, used in the wall-mounted version for fixing the bracket to a pillar, is available on request.

BASE PLATES, FOUNDATION FRAMES AND PLINTHS FOR GBA/CBB/CBE SERIES COLUMN-MOUNTED CRANES

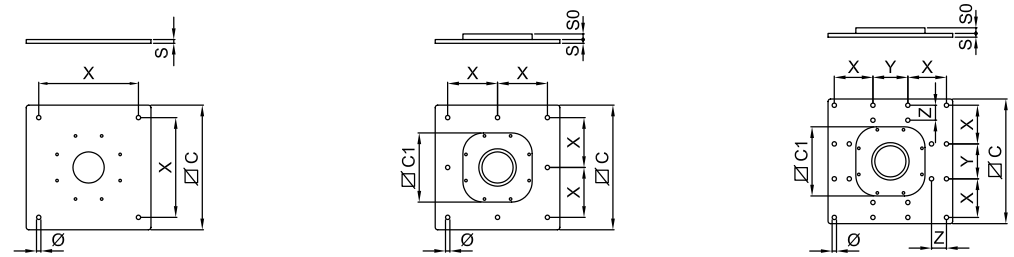
Size		R	S	T	U	V	Z
Base plate and foundation (mm)	⊠ C	205	258	296	372	435	515
	⊠ P	275	340	380	475	555	660
	S1	15	15	15	20	20	25
	S2	8	8	8	8	8	8
	x	247	305	345	432	506	599
	y	103	126	143	179	210	248
	Ø	268	330	373	468	548	648
	r	88	104	116	145	165	197
	ø1	16	20	20	25	29	35
	ø2	13	17	17	21	25	31
Tirafondi (mm)	ØT	M12	M16	M16	M20	M24	M30
	LT	400	450	450	550	600	700
	ST	40	45	45	55	60	75
Clamping couples (Nm)		45	105	105	200	350	680
Frame/bolts weight (kg)		5	10	11	17	26	47
Foundation plinth (mm)	⊠ L	1200	1300	1400	1700	2000	2400
	H	800	800	900	900	1100	1100
Reaction (kN)	Q1	3.3	5.7	10.15	18.4	28.7	29.35
Momentum (kNm)	MF	10	16	30	56	107	163

The dimensions of the plinths are purely indicative! The plinth must be dimensioned by expert, qualified technicians considering the real consistency of the groundand the maximum pressure allowed by this.



Note: The foundation frame with logbolts, used in the column-mounted version for fixing the column itself to the foundation plinth is supplied on request.

COUNTERPLATES FOR FIXING TO THE FLOOR WITH CHEMICAL BOLTS OF THE GBA/CBB/CBE COLUMN-MOUNTED CRANES



N° 4 chevilles chimiques — COUNTERPLATES R | S

N° 8 chevilles chimiques — COUNTERPLATES T | U

N° 20 chevilles chimiques — COUNTERPLATES V | Z

The fixing of the column using chemical bolts, needs a scrupulous check of suitability in relation to the type of support flooring. The suitability checks are the responsibility of the user and must be carried out by expert, qualified technicians who will evaluate the feasibility and formally assume the relative responsibilities.

Size of jib crane		R	S	T	U	V	Z
Counterplate code		GBA1R0PS0	GBA1S0PS0	GBA1T0PS0	GBA1U0PS0	GBA1V0PS0	GBA1Z0PS0

DUTIES AND RESPONSIBILITIES OF THE CLIENT AND/OR THE INSTALLER OF THE JIB CRANE

Preparation of the place of installation of the jib crane

To allow the installation of the jib crane it is necessary to carry out the following operations in advance:

- check suitability, adequacy of the support structures, obtaining the relevant declaration signed by an expert, qualified technician;
- check there are no obvious defects on the support structures and the fixing;
- check the suitability of the maneuvering areas (rotation) available to the jib crane, especially if it operates in areas where there are other cranes and manufacturing machines;
- check the suitability and the correct functioning of the electrical power supply:
  1) correspondence between the voltage of the power line with the voltage for the motors
  2) that there is a suitable switch, selector of the electric line;
  3) adequacy of the section of cable of the electric power line;
  4) the presence and suitability of the earthing system

  Set up the weights for the **test runs as equal to: nominal lifitng capacity x 1,1**
  Set up the weights for the **static runs as equal to: nominal lifting capacity x 1,25.**
  Set up the equipment for the slinging and the lifting of the weights for the load runs.

Installation of the jib crane

The installation of the jib crane, for the importance of the operations, if not carried out correctly can cause **serious risks for the safety of people** nearby in the assembly stage and the successive phase of use of the crane.
In any case this task must be entrusted to specialised installers for the assembly of industrial systems, following careful evaluation of the following parameters:

- environmental characteristics of the place of work (e.g.working surface,etc)
- height of the work level at a height with respect to the load level
- dimensions and weight of the parts to be installed
- available space for the handling of the parts to be installed.

Fixing of the crane to the structures

The check of the suitability of the anchorings to the pillar or to the floor as well as the sizing of the plinths must always be carried out by expert, qualified technicians who will formally assume their responsibilities.

Assembly of the jib crane

Before proceeding to the assembly of the parts and to to the putting into action of the jib crane, the installer must ensure that the characteristics of the crane are adequate to the use which it is intended for and in particular:

1) the lifting capacity of the crane is ≥ with respect to the loads to lift.
2) the characteristics of the fixing structures (plinth, floor, wall, pillar,etc.) have been **"declared suitable"** by the user or by expert technicians, engaged by the user.
3) the characteristics of the lifting unit (trolley/hoist), if not part of the supply, are compatible with those of the jib crane in relation to:
   a. Lifting capacity of the hoist: must be ≤ with respect to the lifting capacity of the jib crane.
   b. **Weight of the trolley/hoist:** must be ≤ with respect to the maximum ones intended
   c. **Lifting/moving speed:** must be ≤ with respect to the maximum ones allowed.
   d. **Headroom of the figure of the hoist trolley:** must be ≤ with respect to those allowed.
   e. **Reactions on the trolley wheels:** must be ≤ with respect to the maximum ones allowed.

In the case of the jib crane with laminate girder, check the width of the wing of the girder which must correspond to that intended for the wheels of the trolley.
Following the installation activities of the jib cranes, it is the precise duty of the installer to:

1) lead the activiiteis of the putting into service as described in the manual of "Instructions for use"
2) fill in the report of the "check and corrrect installation" of the crane, deliberating over the "suitability for use"
3) take care of the complete editing of the responsibility of parts as intended in the checks register.

MADE IN ITALY
DESIGNED FOR THE WORLD

We have created machines for lifting which are simple to install, easy to maneuver and which offer excellent value-for-money.
Available manually or electrically rotated with lifting capacity up to 10.000kg, Donati jib cranes are able to meet the widest requests from the manufacturing and distribution worlds for internal handling of goods and materials.
Designed and planned for uses even in difficult environmental conditions, the jib cranes are real operating machines if used integrated with production centres, tools or work benches. They use normalised elements which allow numerous realisations all standardised.

Donati Sollevamenti is a leader in Italy in the manufacturing of components and products for industrial lifting and handling of goods and materials and for more than 70 years one of the best known and valued companies on the world market.
